

Data Bootcamp: Code Practice #1

Revised: January 30, 2016

Answer each of the questions below. Answers should include any code you write. They can be handwritten, but they must be readable and look professional.

1. Describe and explain what each of these expressions produces in basic Python:

```
2+5
2 + 5
2*5
2/5
2**5
```

2. What is the value of `x` after running these statements in order? Why?

```
x = 7
x = x + 3
```

3. What is the value of `y` after running these statements in order? Of `x`? Why?

```
x = 3
y = x
x = 10
```

4. Does this code run without error? If so, what does it produce? If not, explain why.

```
x = 3
x = x/2
y = 'abc'
z = y + y
print(x, z)
```

5. Does this code run without error? If so, what does it produce? If not, explain why.

```
x = 3
x = x/2
y = 'abc'
z = x + y
print(x, z)
```

6. Does this code run without error? If so, what does it produce? If not, explain why.

```
x = 3
y = 24
z = y / x
print(x, y, z, sep=' | ')
```

7. Does this code run without error? If so, what does it produce? If not, explain why.

```
x = 3
y = '24'
z = y / x
print(x, z)
```

8. Does this code run without error? If so, what does it produce? If not, explain why.

```
x = "I am a #string" # Whoa, a string!
```

9. Does this code run without error? If so, what does it produce? If not, explain why.

```
x = [1, 2, 3]
y = [42, 43]
z = x + y
print(z)
```

10. Does this code run without error? If so, what does it produce? If not, explain why.

```
x = [1, 2, 3]
y = 42
z = x + y
```

11. What “types” are

```
x1 = 12
x2 = 12.0
x3 = '12.0'
x4 = [12]
x5 = [12, 12.0, '12.0']
```

12. Explain the result of each line:

```
type(42)
type(42.0)
type('42.0')
type("42.0")
type("""42.0""")
type([1, 2])
type([1] + [2])
type(1 + 2)
type(print)
```

13. Describe and explain the result of this statement:

```
type(float(str(int('1234'))))
```

14. Describe and explain the result of this statement:

```
type(int(float('12.34')))
```

15. Explain each line:

```
len([1234])  
len("1234")  
len(1234)
```

16. What are the type and length of `x = []`?

17. Convert the string `x = 'abcde'` to a list. What does it look like?

18. Consider the integer `x = 1234`.

- (a) Convert `x` to a floating point number.
- (b) Convert `x` to a string.
- (c) Convert `x` to the list

```
['1', '2', '3', '4']
```

19. *Challenging.* How would you convert `x` to “title case” (first letter of each word capitalized)? *Hint:* Use tab completion to find an appropriate method.

```
x = "luke, i am your father"
```

20. *Challenging.* Consider the string

```
x = "How many characters and words are in this string?"
```

- (a) How many characters does `x` contain?
- (b) Convert `x` to a list of individual characters.
- (c) Convert `x` to a list of individual words. *Hint:* Use tab completion to find a method that splits `x` into pieces.
- (d) How many words does `x` contain?
